Precision Analog Microcontroller, 14-Bit Analog I/O with MDIO Interface, ARM Cortex-M3

Data Sheet

ADuCM320i

FEATURES

- Analog input/output
  - Multichannel, 14-bit, 1 MSPS analog-to-digital converter (ADC)
    - Up to 16 ADC input channels
    - 0 V to V_{REF} analog input range
    - Fully differential and single-ended modes
    - AV_{DD} and IOV_{DD} monitors
  - 12-bit voltage output digital-to-analog converters (VDACs)
    - 8 VDACs with a range of 0 V to 2.5 V or AV_{DD} outputs
  - 12-bit current output DACs (IDACs)
    - 4 IDACS with a range of 0 mA to 150 mA outputs
  - Voltage comparator
- Microcontroller
  - ARM Cortex-M3 processor, 32-bit RISC architecture
  - Serial wire port supports code download and debug
- Clocking options
  - 80 MHz PLL with programmable divider
  - Trimmed on-chip oscillator (±3%)
  - External 16 MHz crystal option
  - External clock source up to 80 MHz
- Memory
  - 2 × 128 kB independent Flash/EE memories
  - 10,000 cycle Flash/EE endurance
  - 20-year Flash/EE retention
  - 32 kB SRAM
- In circuit reprogrammability via I^2C
- On-chip peripherals
  - MDIO slave up to 4 MHz
  - 2 × I^2C, 2 × SPI, UART
  - Multiple general-purpose input/output (GPIO) pins: 3.6 V compliant
  - 7 × 1.2 V compatible when used for MDIO
  - 32-element programmable logic array (PLA)
  - 3 general-purpose timers
  - Wake-up timer
  - Watchdog timer
  - 16-bit pulse width modulator (PWM)
- Power
  - Supply range: 2.9 V to 3.6 V, and 1.8 V to 2.5 V for IDACs
  - Flexible operating modes for low power applications
- Package and temperature range
  - 6 mm × 6mm, 96-ball CSP_BGA package
  - Fully specified for −40°C to +85°C ambient operation
- Tools
  - Low cost QuickStart development system
  - Full third party support

FUNCTIONAL BLOCK DIAGRAM

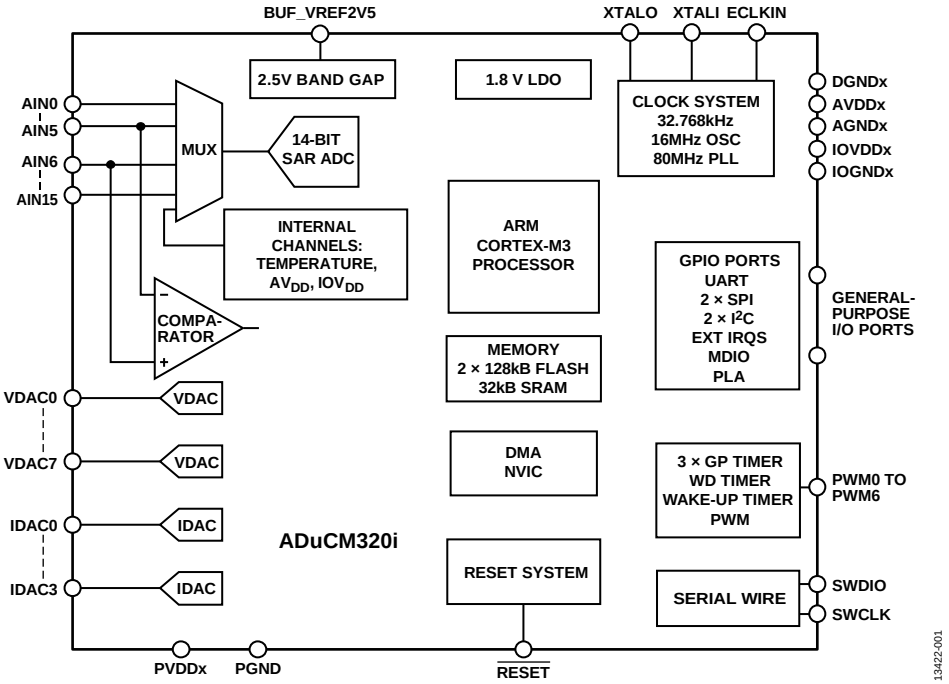

Figure 1.

GENERAL DESCRIPTION

The ADuCM320i is a fully integrated single package device that incorporates high performance analog peripherals together with digital peripherals controlled by an 80 MHz ARM® Cortex™-M3 processor and integral flash for code and data.

The ADC on the ADuCM320i provides 14-bit, 1 MSPS data acquisition on up to 16 input pins that can be programmed for single-ended or differential operation. The voltage at the IDAC output pins can also be measured by the ADC, which is useful for controlling the power consumption of the current DACs. Additionally, chip temperature and supply voltages can be measured.

The ADC input voltage is 0 V to V_{REF}. A sequencer is provided, which allows a user to select a set of ADC channels to be measured in sequence without software involvement during the sequence. The sequence can optionally repeat automatically at a user selectable rate.

Up to eight VDACs are provided with output ranges that are programmable to one of two voltage ranges.

Four IDAC sources are provided. The output currents are programmable with a range of 0 mA to 150 mA. A low drift band gap reference and voltage comparator completes the analog input peripheral set.

The ADuCM320i can be configured so that the digital and analog outputs retain their output voltages and currents through a watchdog or software reset sequence. Thus, a product can remain functional even while the ADuCM320i is resetting itself.

The ADuCM320i has a low power ARM Cortex-M3 processor and a 32-bit RISC machine that offers up to 100 MIPS peak performance. Also integrated on chip are 2 × 128 kB Flash/EE memory and 32 kB of SRAM. The flash comprises two separate 128 kB blocks supporting execution from one flash block and simultaneous writing/erasing of the other flash block.

The ADuCM320i operates from an on-chip oscillator or a 16 MHz external crystal and a PLL at 80 MHz. This clock can optionally be divided down to reduce current consumption. Additional low power modes can be set via software. In normal operating mode, the ADuCM320i digital core consumes about 300 µA per MHz.

The device includes an MDIO interface capable of operating at up to 4 MHz. The capability to simultaneously execute from one flash block and write/erase the other flash block makes the ADuCM320i ideal for 10G, 40G, and 100G optical applications. User programming is eased by incorporating PHYADR and DEVADD hardware comparators. In addition, the nonerasable kernel code plus flags in user flash provide assistance by allowing user code to robustly switch between the two blocks of user flash code and data spaces.

The ADuCM320i integrates a range of on-chip peripherals that can be configured under software control, as required in the application. These peripherals include 1 × UART, 2 × I^2C, and 2 × SPI serial input/output (I/O) communication controllers, GPIO, 32-element programmable logic array, 3 general-purpose timers, plus a wake-up timer and system watchdog timer. A 16-bit PWM with seven output channels is also provided.

GPIO pins on the device power up in high impedance input mode. In output mode, the software chooses between open-drain mode and push-pull mode. The pull-up resistors can be disabled and enabled in software. In GPIO output mode, the inputs can remain enabled to monitor the pins. The GPIO pins can also be programmed to handle digital or analog peripheral signals, in which case the pin characteristics are matched to the specific requirement.

A large support ecosystem is available for the ARM Cortex-M3 processor to ease product development of the ADuCM320i. Access is via the ARM serial wire debug port (SW-DP). On-chip factory firmware supports in-circuit serial download via I^2C. These features are incorporated into a low cost QuickStart™ development system supporting this precision analog microcontroller family.

Note that throughout this data sheet, multifunction pins, such as VDAC0/P5.3, are referred to either by the entire pin name or by a single function of the pin, for example, VDAC0, when only that function is relevant.

SPECIFICATIONS

MICROCONTROLLER ELECTRICAL SPECIFICATIONS

AV_{DD} (the voltage applied to the AVDD3 and AVDD4 pin) = IOV_{DDx} (the voltage applied to the IOVDDx pins (IOVDD0, IOVDD1, IOVDD2)) = V_{DDI} (the voltage applied to the VDD1 pin) = 2.9 V to 3.6 V (see Figure 14) maximum difference between supplies = 0.3 V, V_{REF} = 2.5 V internal reference, f_{CORE} = 80 MHz, T_A = −40°C to +85°C, unless otherwise noted. PV_{DDx} (the voltage applied to the PVDDx pins (PVDD0, PVDD1, PVDD2, PVDD3)) for IDACs = 1.8 V to 2.5 V. Power-up sequence must be VDD1, IOVDDx, AVDDx, and then PVDDx, but no delays in the sequence are required.

Thermal Performance						
Impedance, Junction to Ambient			45		°C/W	JEDEC 2S2P

[1] These numbers are not production tested but are guaranteed by design and/or characterization data at production release.
[2] Enabling the input buffer changes the ADC input characteristics as described in these specifications (the ADC Input Buffer specifications).
[3] The data in the Microcontroller Electrical Specifications section also applies for a load of R_L = 1 kΩ and C_L = 100 pF to ground but only for 0 V to 2.5 V. However, this is not production tested.
[4] DAC linearity is calculated using a reduced code range of 100 to 3900.
[5] DAC gain error is calculated using a reduced code range of 100 to an internal 2.5 V V_{REF}.
[6] Due to self heating, internal temperature measurements cannot be used to predict external temperatures. This value is only relevant after user calibration and only for internal and external conditions identical to those at calibration.
[7] The average current from all GPIO pins must not exceed 3 mA per pin.
[8] Power specifcations exclude any load currents to external circuits.

ABSOLUTE MAXIMUM RATINGS

All requirements applicable to each pin must be met. Where multiple limits apply to a pin each one must be met individually. The limits apply according to the functionality of the pins at the time. Pins that can be either analog or digital, that is, that have two types indicated in the pin descriptions, must meet the limits for both types. For pin types, see Table 10.

When powered up, all ground pins and ADC_REFN must be connected together to a node referred to as GND in Table 9. The limits that are listed must be reduced by any difference between any GNDx pin. Also, AVDD3 must be connected to AVDD4 and IOVDD1 must be connected to IOVDD3.

Table 9.

Parameter	Rating
Any Pin to GND	−0.3 V to +3.9 V
Any PVDDx Pin to GND	−0.3 V to +2.8 V
MDIO[1], MCK, and PRTADDR0 to PRTADDR4 in MDIO Mode to GND	−0.3 V to +2.1 V
Between Any of AVDDx, IOVDDx, and VDD1 Pins	−0.3 V to +0.3 V
Any Type I Pin to GND[2]	−0.3 V to IOVDDx + 0.3 V
Any Type AI or AO Pin to GND[3]	−0.3 V to AVDDx + 0.3 V
Any IDACx, CDAMPx, IDAC_TST, IREF to GND	−0.3 V to PVDDx + 0.3 V
ADC_REFP to GND	−0.3 V to AVDDx + 0.3 V
Total Positive GPIO Pin Currents	0 mA to 30 mA
Total Negative GPIO Pin Currents	−30 mA to 0 mA
Maximum Power Dissipation	1 W
Operating Ambient Temperature Range	−40°C to +85°C
Storage Temperature Range	−65°C to +160°C
Operating Junction Temperature Range	−40°C to +120°C
ESD HBM	4 kV
ESD FICDM	1 kV

[1] Note that this pin is always in MDIO mode.
[2] This limit does not apply if no current can be drawn by external circuits on IOVDDx because, in this case, IOV_{DD} follows to a suitable level.
[3] This limit does not apply if no current can be drawn by external circuits on AVDDx because, in this case, AV_{DD} follows to a suitable level.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

L8	AIN4	AI	Analog Input 4.
L9	AIN5	AI	Analog Input 5. AIN5 can be the negative input for the comparator.
K9	AIN6	AI	Analog Input 6. AIN6 is also the positive input for the comparator.
J9	AIN7	AI	Analog Input 7.

Pin No.	Mnemonic	Type[1]	Description
L10	AIN8/P4.2	AI/I/O	Analog Input 8 (AIN8). Digital I/O Port 4.2 (P4.2).
K10	AIN9/P4.3	AI/I/O	Analog Input 9 (AIN9). Digital I/O Port 4.3 (P4.3).
J10	AIN10	AI	Analog Input 10.
J11	AIN11/BUF_VREF2V5	AI/AO	Analog Input 11 (AIN11). Buffered 2.5 V Bias (BUF_VREF2V5). The maximum load is 1.2 mA. Connect BUF_VREF2V5 to AGNDx via a 100 nF capacitor.
H10	AIN12/P4.4	AI/I/O	Analog Input 12 (AIN12). Digital I/O Port 4.4 (P4.4).
G10	AIN13/P4.5	AI/I/O	Analog Input 13 (AIN13). Digital I/O Port 4.5 (P4.5).
H9	AIN14/P4.6	AI/I/O	Analog Input 14 (AIN14). Digital I/O Port 4.6 (P4.6).
G9	AIN15/P4.7	AI/I/O	Analog Input 15 (AIN15). Digital I/O Port 4.7 (P4.7).
L5	VDAC0/P5.3	AO/I/O	Voltage DAC0 Output (VDAC0). Digital I/O Port 5.3 (P5.3).
K5	VDAC1	AO	Voltage DAC1 Output.
L4	VDAC2/P3.7/PLAO[29]	AO/I/O	Voltage DAC2 Output (VDAC2). Digital I/O Port 3.7 (P3.7). Output of PLA Element 29 (PLAO[29]).
K4	VDAC3/P5.0	AO/I/O	Voltage DAC3 Output (VDAC3). Digital I/O Port 5.0 (P5.0).
J4	VDAC4	AO	Voltage DAC4 Output (VDAC4).
L3	VDAC5	AO	Voltage DAC5 Output (VDAC5).
K3	VDAC6/P5.1	AO/I/O	Voltage DAC6 Output (VDAC6). Digital I/O Port 5.1 (P5.1).
J3	VDAC7/P5.2	AO/I/O	Voltage DAC7 Output (VDAC7). Digital I/O Port 5.2 (P5.2).
A2	IDAC0	AO	IDAC0. 0 mA to 150 mA full-scale output.
A3	PVDD0	S	Power for IDAC0.
B4	CDAMP0	AI	Damping Capacitor 0. Connect a damping capacitor from this pin to PVDD0.
A10	IDAC1	AO	IDAC1. 0 mA to 150 mA full-scale output.
A9	PVDD1	S	Power for IDAC1.
B8	CDAMP1	AI	Damping Capacitor 1. Connect a damping capacitor from this pin to PVDD1.
A5	IDAC2	AO	IDAC2. 0 mA to 150 mA full-scale output.
A4	PVDD2	S	Power for IDAC2.
B5	CDAMP2	AI	Damping Capacitor 2. Connect a damping capacitor from this pin to PVDD2.
A7	IDAC3	AO	IDAC3. 0 mA to 150 mA full-scale output.
A8	PVDD3	S	Power for IDAC3.
B7	CDAMP3	AI	Damping Capacitor 3. Connect a damping capacitor from this pin to PVDD3.
B6	PGND	S	Power Supply Ground for IDACs.
A6	PGND	S	Power Supply Ground for IDACs.
A1	IDAC_TST	AI/AO	Pin for IDAC Test Purposes. Leave IDAC_TST unconnected.
L2	DVDD_1V8	AO	1.8 V Digital Supply. A 470 nF capacitor to DGND1 must be connected to this pin to stabilize the internal 1.8 V regulator that supplies flash memory and the ARM Cortex-M3 processor.
K2	DVDD_2V5	AO	2.5 V Digital Supply. A 470 nF capacitor to IOGND3 must be connected to this pin to stabilize the internal 2.5 V regulator that supplies the analog digital control.

Pin No.	Mnemonic	Type[1]	Description
F9	AVDD_REG0	AO	Analog Regulator 0 Supply. A 470 nF capacitor to AGND4 must be connected to this pin to stabilize the internal 2.5 V regulator that supplies the ADC.
F10	AVDD_REG1	AO	Analog Regulator 1 Supply. Output of 2.5 V on-chip LDO regulator. A 470 nF capacitor to AGND4 must be connected to this pin. This regulator supplies the IDACs.
L1	DGND1	S	Digital Ground 1 for DVDD_1V8.
D10	DGND2	S	Digital Ground 2. Connect to DGND1.
B1	IOVDD1	S	3.3 V GPIO Supply.
D11	IOVDD2	S	3.3 V GPIO Supply and Interdie Communications.
J1	IOVDD3	S	3.3 V GPIO Supply.
C1	IOGND1	S	Ground for IOVDD1.
E11	IOGND2	S	Ground for IOVDD2.
K1	IOGND3	S	Ground for IOVDD3 and Interdie Communications.
J5	AGND1	S	Analog Ground for VDD1.
K7	AGND2	S	ESD Ground for Pad Ring.
L7	AGND3	S	Ground for AVDD3.
H11	AGND4	S	Ground for AVDD4, AVDD_REG0, and AVDD_REG1.
K6	VDD1	S	3.3 V Supply for Digital Die.
L6	AVDD3	S	VDAC and IDAC Supply (3.3 V).
G11	AVDD4	S	ADC Supply (3.3 V).
L11	ADC_REFN	AO/A	Negative Decoupling Capacitor Connection for ADC Reference Buffer. Connect this pin to AGND4.
K11	ADC_REFP	AO/A	Positive Decoupling Capacitor Connection for ADC Reference Buffer. Connect this pin to a 4.7 µF capacitor to the ADC_REFN pin. ADC_REFP can be overdriven by an external reference.
H2	XTALO	O	Output from the Crystal Oscillator Inverter. When not using an external crystal, leave XTALO unconnected.
J2	XTALI	I	Input to the Crystal Oscillator Inverter and Input to the Internal Clock Generator Circuits. When not using an external crystal, connect XTALI to DGNDx.

[1] I is digital input, O is digital output, S is supply, AI is analog input, and AO is analog output.

APPLICATIONS INFORMATION

RECOMMENDED CIRCUIT AND COMPONENT VALUES

Figure 15 shows a typical connection diagram for the ADuCM320i.

Supplies and regulators must be adequately decoupled with capacitors connected between the AVDDx, PVDDx, DVDD_x, AVDD_REGx, IOVDDx, and VDD1 balls and their associated GND balls (AGNDx, PGND, IOGNDx, and DGNDx). Table 10 indicates which ground balls are paired with which supply balls.

There are four digital supply balls, IOVDD1, IOVDD2, IOVDD3, and VDD1. Decouple these balls with a 100 nF capacitor placed as near as possible to each of the four balls and their associated GND balls (IOGNDx and AGND1, respectively). In addition, place a 10 µF capacitor conveniently near to these balls.

Similarly, the analog supply pins, AVDD3 and AVDD4, each require a 100 nF capacitor placed as near as possible to each ball and its associated AGNDx ball, and place a 10 µF capacitor conveniently near to these balls.

The IDACs source their output currents from the PVDDx supply balls. Each PVDDx supply ball must have a 100 nF capacitor near to each ball and their associated GND balls (PGND). In addition, place at least one 10 µF capacitor at the source of the PVDDx supply.

The IDAC output filters depend on a 10 nF capacitor being placed between the CDAMPx and PVDDx pins.

The ADC reference requires a 4.7 µF capacitor placed between ADC_REFP and ADC_REFN and located as near as possible to each ball. ADC_REFN must be connected directly to AGND4.

The ADuCM320i contains four internal regulators. These regulators require external decoupling capacitors. The DVDD_1V8 and DVDD_2V5 balls each require a 470 nF capacitor to DGND1 and IOGND3, respectively. AVDD_REG0 and AVDD_REG1 each require a decoupling capacitor to AGND4.

To generate an accurate and low drift reference current, connect the IREF ball to AGND4 via a low ppm 3.16 kΩ resistor.

Take care in the layout to ensure that currents flowing from the ground end of each decoupling capacitor to its associated ground ball share as little track as possible with other ground currents on the printed circuit board.
