## Arm® Cortex®-M0 Microcontroller with LIN and H-Bridge NFET Driver for Automotive Applications AD-Step

### 1 Overview

#### Features

- 32-bit Arm® Cortex®-M0 Core
  - up to 40 MHz clock frequency
  - one clock per machine cycle architecture
  - single cycle multiplier
- On-chip memory
  - 64 KB Flash (including EEPROM)
  - 4 KB EEPROM (emulated in Flash)
  - 512 bytes 100 Time Programmable Memory (100TP)
  - 4 KB RAM
  - Boot ROM for startup firmware and Flash routines
- Math Co-Processor Unit with Divider Unit for signed and unsigned 32-bit division operations
- On-chip OSC and PLL for clock generation
  - PLL loss-of-lock detection
- MOSFET Driver including charge pump for H-Bridge motor applications
- Current Sense Amplifier
- High-Side Switch with cyclic sense option and PWM functionality, e.g. for supplying LEDs or switch panels (min. 150 mA)
- 4 High Voltage Monitor Input pins for wake-up and with cyclic sense with analog measurement option
- 10 General-purpose I/O Ports (GPIO)
- 5 Analog input Ports
- 10-Bit A/D Converter with 5 analog inputs + VBAT\_SENSE + VS + 4 high voltage monitoring inputs
- 8-Bit A/D Converter with 9 inputs for voltage and temperature supervision
- Measurement unit with 12 channels together with the onboard 10-Bit A/D converter and data post processing
- 16-Bit timers - GPT12, Timer 2 and Timer 21

\* Arm and Cortex are registered trademarks of Arm Limited, UK

## Overview

- Capture/compare unit for PWM signal generation (CCU6)
- 2 full duplex serial interfaces (UART1, UART2), UART1 with LIN support
- 2 synchronous serial channels (SSC1, SSC2)
- On-chip debug support via 2-wire SWD
- 1 LIN 2.2 transceiver
- Single power supply  $V_S = 5.5\text{ V to }28\text{ V}$
- Extended supply voltage range  $V_S = 3\text{ V to }28\text{ V}$
- Low-dropout voltage regulators (LDO)
- 5 V voltage supply VDDEXT for external loads (e.g. Hall-sensor)
- Core logic supply at 1.5 V
- Programmable window watchdog (WDT1) with independent on-chip clock source
- Power saving modes:
  - Micro Controller Unit slow-down mode
  - Sleep Mode with cyclic sense option
  - Cyclic wake-up during Sleep Mode
  - Stop Mode with cyclic sense option
- Power-on and undervoltage/brownout reset generator
- Overtemperature protection incl. shutdown
- Short circuit protection for all voltage regulators and actuators (High Side Switch)
- Loss of clock detection with fail safe mode for power switches
- Temperature Range  $T_J = -40^\circ\text{C to }+150^\circ\text{C}$
- Package VQFN-48-31 with LTI feature
- Green package (RoHS compliant)
- AEC Qualified

## Potential applications

- Window lift
- Sunroof
- Single-phase DC pumps and fans, e.g. HVAC blower
- Single-phase BLDC pumps and fans, e.g. single-phase water pump
- ... and other LIN addressed motor control applications

## Product validation

Qualified for Automotive Applications. Product Validation according to AEC-Q100/101

## Description

TLE985x devices integrate an Arm® Cortex®-M0 processor and peripherals for motor control, power supply and communication. Two integrated measurement units (analog-to-digital converters) for monitoring temperature, battery voltage and four monitoring inputs help to save pins. These inputs can be operated directly with battery voltage, which saves costs on additional components such as external voltage dividers or

## Overview

shutdown transistors. Furthermore, the chips are equipped with two full duplex serial interfaces (UART) with LIN support.

A new feature in the TLE985x family is its adaptive MOSFET driver. The control algorithm is able to compensate MOSFET parameter spread in the system by automatically adjusting the gate current according to required switching times. This allows an optimization of the system concerning EME (electro-magnetic emissions, slow slew rates) as well as power dissipation (short dead times) simultaneously.

The product family includes several devices with different flash sizes (48 - 96KB) and temperature ranges ( $T_j$  up to 175°C). In addition, different numbers of half-bridge drivers for uni- or bidirectional DC motor applications are offered.

All TLE985x products are based on the same hardware and software platform as Infineon's other Embedded Power products (TLE984x, TLE986x and TLE987x), thus enabling design synergies and allowing customers to reuse parts of the software. The devices come in a leadless VQFN package with a footprint of 7x7 mm.

## General Device Information

### 3.2 Pin Definitions and Functions

After reset, all pins are configured as input (except supply and LIN pins) with one of the following settings:

- Pull-up enabled only (PU)
- Pull-down enabled only (PD)
- Input with both pull-up and pull-down disabled (I)
- Output with output stage deactivated = high impedance state (Hi-Z)

The functions and default states of the TLE9854QX external pins are provided in the following table.

Type: indicates the pin type.

- I/O: Input or output
- I: Input only
- O: Output only
- P: Power supply

Not all alternate functions listed, see [Chapter 14](#).

Modes of Operations

### 4 Modes of Operations

This highly integrated circuit contains analog and digital functional blocks. For system and interface control an embedded 32-Bit Arm® Cortex®-M0 microcontroller is included. For internal and external power supply purposes, on-chip low drop-out regulators are existent. An internal oscillator (no external components necessary) provides a cost effective and suitable clock in particular for LIN slave nodes. As communication interface, a LIN transceiver and several High Voltage Monitor Inputs with adjustable threshold and filters are available. Furthermore one High-Side Switch (e.g. for driving LEDs or powering of switches), a driver for 4 n-channel MOSFETs including a two-stage charge pump and several general purpose input/outputs (GPIO) with pulse-width modulation (PWM) capabilities are available.

The Micro Controller Unit supervision and system protection including reset feature is controlled by a programmable window watchdog. A cyclic wake-up circuit, supply voltage supervision and integrated temperature sensors are available on-chip.

All relevant modules offer power saving modes in order to support terminal 30 connected automotive applications. A wake-up from the power saving mode is possible via a LIN bus message, via the monitoring inputs or repetitive with a programmable time period (cyclic wake-up).

The integrated circuit is available in a VQFN-48-31 package with 0.5 mm pitch and is designed to withstand the challenging conditions of automotive applications.

The TLE9854QX has several operational modes mainly to support low power consumption requirements. The low power modes and state transitions are depicted in **Figure 3** below.

**Figure 3 Power Control State Diagram**

## Modes of Operations

### Reset Mode

The Reset Mode is a transition mode e.g. during power-up of the device after a power-on reset. In this mode the on-chip power supplies are enabled and all other modules are initialized. Once the core supply VDDC is stable, the Active Mode is entered. In case the watchdog timer WDT1 fails for more than four times, a fail-safe transition to the Sleep Mode is done.

### Active Mode

In Active Mode all modules are activated and the TLE9854QX is fully operational.

### Stop Mode

The Stop Mode is one out of two major low power modes. The transition to the low power modes is done by setting the respective Bits in the mode control register. In Stop Mode the embedded microcontroller is still powered allowing faster wake-up reaction times, but not clocked. A wake-up from this mode is possible by LIN bus activity, the High Voltage Monitor Input pins or the respective 5V GPIOs.

### Sleep Mode

The Sleep Mode is a major low-power mode. The transition to the low-power modes is done by setting the respective Bits in the Micro Controller Unit mode control register. The sleep time is configurable. In Sleep Mode the embedded microcontroller power supply is deactivated, allowing the lowest system power consumption, but the wake-up time is longer compared to the Stop Mode. In this mode a 64 bit wide buffer for data storage is available. A wake-up from this mode is possible by LIN bus activity or the High Voltage Monitor Input pins and cyclic wake. A wake-up from Sleep Mode behaves similar to a power-on reset. While changing into Sleep Mode, no incoming wake-requests are lost (i.e. no dead-time). It is possible to enter sleep-mode even with LIN dominant.

### Cyclic Wake-up Mode

The cyclic wake-up mode is a special operating mode of the Sleep Mode and the Stop Mode. The transition to the cyclic wake-up mode is done by first setting the respective Bits in the mode control register followed by the SLEEP or STOP command. Additional to the cyclic wake-up behavior (wake-up after a programmable time period), the wake-up sources of the normal Stop Mode and Sleep Mode are available.

### Cyclic Sense Mode

The cyclic sense mode is a special operating mode of the Sleep Mode and the Stop Mode. The transition to the cyclic sense mode is done by first setting the respective Bits in the mode control register followed by the STOP or SLEEP command. In cyclic sense mode the High Side Switch can be switched on periodically for biasing some switches for example. The wake-up condition is configurable, when the sense result of defined monitor inputs at a window of interest changed compared to the previous wake-up period or reached a defined state respectively. In this case the Active Mode is entered immediately.

The following table shows the possible power mode configurations of each major module or function respectively.

**Table 2 Power Mode Configurations**

Module/function	Active Mode	Sleep Mode	Stop Mode	Comment
VPRE, VDDP, VDDC	ON	OFF	ON	–
VDDEXT	ON/OFF	OFF	cyclic ON/OFF	–
HS	ON/OFF	cyclic ON/OFF	cyclic ON/OFF	cyclic sense

LP_CLK2 ( $f_{LP\_CLK2}$ )	ON	ON	ON	for cyclic wake-up

1) Bridge Driver “Hold Mode” is available in sleep mode and stop mode.

2) May not be switched off due to safety reasons

### Wake-up Source Prioritization

All wake-up sources have the same priority. In order to handle the asynchronous nature of the wake-up sources, the first wake-up signal will initiate the wake-up sequence. Nevertheless all wake-up sources are latched in order to provide all wake-up events to the application software. The software can clear the wake-up source flags. It is ensured, that no wake-up event is lost.

As default wake-up sources, MON inputs and cyclic wake are activated after power-on reset, LIN is disabled as wake-up source by default.

### Wake-up Levels and Transitions

The wake-up can be triggered by rising, falling or both signal edges for each monitor input individually.

## **5 Power Management Unit (PMU)**

### **5.1 Features**

- System modes control (startup, sleep, stop and active)
- Power management (cyclic wake, cyclic sense)
- Control of system voltage regulators with diagnosis (overload, short, overvoltage)
- Fail safe mode detection and operation in case of system errors
- Wake-up sources configuration and management (LIN, MON, GPIOs)
- System error logging

### **5.2 Introduction**

The purpose of the power management unit is to ensure the fail safe behavior of the system IC. Therefore the power management unit controls all system modes including the corresponding transitions. The power management unit is responsible for generating all needed voltage supplies for the embedded MCU (VDDC, VDDP) and the external supply (VDDEXT). Additionally, the PMU provides well defined sequences for the system mode transitions and generates hierarchical reset priorities. The reset priorities control the reset behavior of all system functionalities especially the reset behavior of the embedded MCU. All these functions are controlled by finite state machines. The system master functionality of the PMU requires the generation of an independent logic supply and system clock. Therefore the PMU has a module internal logic supply and system clock which works independently of the MCU clock.

**Power Management Unit (PMU)****5.3 Power Supply Generation (PGU)****5.3.1 Voltage Regulator 5.0V (VDDP)**

This module represents the 5 V voltage regulator, which provides the pad supply for the parallel port pins and other 5 V analog functions (e.g. LIN Transceiver).

**Features**

- 5 V low-drop voltage regulator
- Overcurrent Monitoring and Shutdown with MCU signalling (Interrupt)
- Overvoltage monitoring with MCU signalling (Interrupt)
- Undervoltage monitoring with MCU signalling (Interrupt)
- Undervoltage monitoring with Reset (UnderVoltage Reset,  $V_{DDPUV}$ )
- Overtemperature Shutdown with MCU signalling (Interrupt)
- Pre-Regulator for VDDC Regulator
- GPIO Supply
- Pull Down Current Source at the output for Sleep Mode only

The output capacitor  $C_{VDDP}$  is mandatory to ensure a proper regulator functionality.

### 5.3.2 Voltage Regulator 1.5V (VDDC)

This module represents the 1.5 V voltage regulator, which provides the supply for the microcontroller core, digital peripherals and other chip internal analog 1.5 V functions (e.g. ADC).

#### Features

- 1.5 V low-drop voltage regulator
- Overcurrent monitoring and Shutdown with MCU signalling (Interrupt)
- Overvoltage monitoring with MCU signalling (Interrupt)
- Undervoltage monitoring with MCU signalling (interrupt)
- Undervoltage monitoring with reset
- Overtemperature Shutdown with MCU signalling (Interrupt)
- Pull Down Current Source at the output for Sleep Mode only

The output capacitor  $C_{VDDC}$  is mandatory to ensure a proper regulator functionality.

### 5.3.3 External Voltage Regulator 5.0V (VDDEXT)

This module represents the 5 V voltage regulator, which serves as a supply for external circuits. It can be used e.g. to supply an external sensor, LEDs or potentiometers.

#### Features

- Switchable (by software) 5 V low-drop voltage regulator
- Switch-on undervoltage blanking time in order to drive small capacitive loads
- Intrinsic current limitation
- Undervoltage monitoring and shutdown with MCU signalling (Interrupt)
- Overtemperature Shutdown with MCU signalling (Interrupt)
- Resistive discharge path at the output if the regulator is off
- Cyclic sense option together with GPIOs
- Low current mode available to ensure reduced stop mode current consumption. In this mode current capability is reduced to  $I_{VDDEXT\_LCM}$

The output capacitor  $C_{VDDEXT}$  is mandatory to ensure a proper regulator functionality.

- Reset management of all system resets
- System modes control for all power modes (active, power down, sleep)
- Interrupt enabling for many system peripherals
- General purpose input output control
- Debug mode control of system peripherals

### **6.2 Introduction**

The System Control Unit (SCU) supports all central control tasks in the TLE9854QX. The SCU is made up of the following sub-modules:

- Clock System and Control (CGU)
- Reset Control (RCU)
- Power Management (PCU)
- Interrupt Management (ICU)
- General Port Control
- Flexible Peripheral Management
- Module Suspend Control
- Watchdog Timer (WDT)
- Error Detection and Correction in Data Memory
- Miscellaneous Control
- Register Mapping

### 6.3 Clock Generation Unit

The Clock Generation Unit (CGU) provides a flexible clock generation for TLE9854QX. During user program execution the frequency can be programmed for an optimal ratio between performance and power consumption. Therefore the power consumption can be adapted to the actual application state.

The CGU in the TLE9854QX consists of one oscillator circuit (OSC\_HP), a Phase-Locked Loop (PLL) module including an internal oscillator (OSC\_PLL) and a Clock Control Unit (CCU). The CGU can convert a low-frequency input/external clock signal to a high-frequency internal clock.

The system clock  $f_{\text{SYS}}$  is generated out of the following selectable clocks:

- PLL clock output  $f_{\text{PLL}}$
- Direct clock from oscillator OSC\_HP  $f_{\text{OSC}}$
- Direct output of internal Oscillator  $f_{\text{INTOSC}}$
- Low precision clock  $f_{\text{LP\_CLK}}$  (HW-enabled for startup after reset and during power-down wake-up sequence)

The following sections describe the different parts of the CGU.

#### 6.3.1 Low Precision Clock

The clock source LP\_CLK is a low-precision RC oscillator (LP-OSC, see  $f_{\text{LP\_CLK}}$ ) that is enabled by hardware as an independent clock source for the TLE9854QX startup after reset and during the power-down wake-up sequence. There is no user configuration possible on  $f_{\text{LP\_CLK}}$ .

#### 6.3.2 High Precision Oscillator Circuit (OSC\_HP)

The high precision oscillator circuit, designed to work with both an external crystal oscillator or an external stable clock source, consists of an inverting amplifier with XTAL1 as input, and XTAL2 as output.

**Figure 11** shows the recommended external circuitries for both operating modes, External Crystal Mode and External Input Clock Mode.

##### 6.3.2.1 External Input Clock Mode

When supplying the clock signal directly, not using an external crystal and bypassing the oscillator, the input frequency needs to be equal to or greater than 4 MHz if the PLL VCO part is used.

When using an external clock signal it must be connected to XTAL1. XTAL2 is left open (unconnected).

##### 6.3.2.2 External Crystal Mode

When using an external crystal, its frequency can be within the range of 4 MHz to 16 MHz. An external oscillator load circuitry must be used, connected to both pins, XTAL1 and XTAL2. It consists normally of the two load capacitances C1 and C2, for some crystals a series damping resistor might be necessary. The exact values and related operating range are dependent on the crystal and have to be determined and optimized together with the crystal vendor using the negative resistance method. As starting point for the evaluation, the following load cap values may be used:

**Table 4 External CAP Capacitors**

Fundamental Mode Crystal Frequency (approx., MHz)	Load Caps $C_1, C_2$ (pF)
4	33
8	18
12	12
16	10

System Control Unit - Digital Modules (SCU-DM)

Figure 11 TLE9854QX External Circuitry for the OSC\_HP

## System Control Unit - Digital Modules (SCU-DM)

### 6.3.3 Clock Control Unit

The Clock Control Unit (CCU) receives the clock from the PLL  $f_{PLL}$ , the external input clock  $f_{OSC}$ , the internal input clock  $f_{INTOSC}$ , or the low-precision input clock  $f_{LP\_CLK}$ . The system frequency is derived from one of these clock sources.

**Figure 12** Clock Inputs to Clock Control Unit

The CCU generates all necessary clock signals within the microcontroller from the system clock. It consists of:

- Clock slow down circuitry
- Centralized enable/disable circuit for clock control

In normal running mode, the main module frequencies (synchronous unless otherwise stated) are as follows:

- System frequency,  $f_{SYS}$  = up to 40 MHz (measurement interface clock MI\_CLK is derived from this clock)
- CPU clock (CCLK, SCLK) = up to 40 MHz (divide-down of NVM access clock)
- NVM access clock (NVMACCCLK) = up to 40 MHz
- Peripheral clock (PCLK, PCLK2, NVMCLK) = up to 40 MHz (equals CPU clock; must be same or higher)

Some peripherals are clocked by PCLK, others clocked by PCLK2 and the NVM is clocked by both NVMCLK and NVMACCCLK. During normal running mode, PCLK = PCLK2 = NVMCLK = CCLK. On wake-up from power-down mode, PCLK2 is restored similarly like NVMCLK, whereas PCLK is restored only after PLL is locked.

For optimized NVM access (read/write) with reduced wait state(s) and with respect to system requirements on CPU operational frequency, bit field NVMCLKFAC is provided for setting the frequency factor between the NVM access clock NVMACCCLK and the CPU clock CCLK.

For the slow down mode, the operating frequency is reduced using the slow down circuitry with clock divider setting at the bit field CLKREL. Bit field CLKREL is only effective when slow down mode is enabled via SFR bit PMCON0.SD bit. Note that the slow down setting of bit field CLKREL correspondingly reduces the NVMACCCLK clock. Slow down setting does not influence the erase and write cycles for the NVM.

**Peripherals UART1, UART2, T2 and T21 are not influenced by CLKREL and either not by NVMCLKFAC, to allow functional LIN communication in slow down mode.**

## 8 Arm® Cortex®-M0 Core

### 8.1 Features

The key features of the Arm® Cortex®-M0 implemented are listed below.

#### **Processor Core. A low gate count core, with low latency interrupt processing:**

- Thumb® + Thumb-2® Instruction Set
- Banked stack pointer (SP) only
- Handler and thread modes
- Thumb and debug states
- Interruptible-continued instructions LDM/STM, Push/Pop for low interrupt latency
- Automatic processor state saving and restoration for low latency Interrupt Service Routine (ISR) entry and exit
- Arm® architecture v6-M Style
- Arm®v6 unaligned accesses
- SysTick (typ. 1ms)

#### **Nested Vectored Interrupt Controller (NVIC) closely integrated with the processor core to achieve low latency interrupt processing:**

- External interrupts, configurable from 1 to 24
- 7 interrupt priority registers for levels from 0 up to 192 in steps of 64
- Dynamic repriorization of interrupts
- Priority grouping. This enables selection of pre-empting interrupt levels and non pre-empting interrupt levels
- Support for tail-chaining and late arrival of interrupts. This enables back-to-back interrupt processing without the overhead of state saving and restoration between interrupts.
- Processor state automatically saved on interrupt entry, and restored on interrupt exit, with no instruction overhead

#### **Bus interfaces**

- Advanced High-performance Bus-Lite (AHB-Lite) interfaces

### 8.2 Introduction

The Arm® Cortex®-M0 processor is a leading 32-bit processor and provides a high-performance and cost-optimized platform for a broad range of applications including microcontrollers, automotive body systems and industrial control systems. Like the other Arm® Cortex® family processors, the Arm® Cortex®-M0 processor implements the Thumb®-2 instruction set architecture. With the optimized feature set the Arm® Cortex®-M0 delivers 32-bit performance in an application space that is usually associated with 8- and 16-bit microcontrollers.

### 10.3 NVM Module (Flash Memory)

The Flash memory provides an embedded user-programmable non-volatile memory, allowing fast and reliable storage of user code and data.

#### Features

- In-System Programming via LIN (Flash mode) and SWD
- Error Correction Code (ECC) for detection of single Bit and double Bit errors and dynamic correction of single Bit errors on Data Block (Double words, 64 bits).
- Interrupt and signaling of double bit error by NMI, address of double bit error readable by FW API user routine
- Possibility of checking single bit error occurrence by ROM routines
- Program width of 128 Byte (page)
- Minimum erase width of 128 Byte (page)
- Integrated hardware support for EEPROM emulation
- 8 Byte read access
- Physical read access time: max. 75 ns
- Code read access acceleration integrated (read buffer)
- Page program time: typ. 3 ms
- Page erase (128 bytes) and sector erase (4K bytes) time: typ. 4 ms
- 4 individual protection passwords for NVM customer BSL region, code region, data linear region, and data mapped region
- Security option to protect read out via debug interface in application run mode
- Write/erase access to 100TP (e.g. option bytes) is possible via the debug interface

*Note: The user has to ensure that no flash operations which change the content of the flash get interrupted at any time.*

The clock for the NVM is supplied with the system frequency  $f_{\text{sys}}$ . Integrated firmware routines are provided to ease NVM, and other operations including EEPROM emulation.

## Interrupt System

# 11 Interrupt System

## 11.1 Features

- 23 interrupt nodes for on-chip peripherals
- 8 NMI nodes for critical system events
- Maximum flexibility (resp. priority and node grouping) for all interrupt nodes

## 11.2 Introduction

### 11.2.1 Overview

The TLE9854QX supports 24 interrupt vectors with 4 priority levels. 21 of these interrupt vectors are assigned to the on-chip peripherals: GPT12, SSC1, SSC2, CCU6, High-Side Switch, WAKEUP, Bridge Driver, Charge Pump, Differential Unit, Math Divider, GPIOs, MONs, CSA and A/D Converter are each assigned to one dedicated interrupt vector; while UART1 and Timer2 or UART2, External Interrupt 2 and Timer21 share interrupt vectors. Two vectors are dedicated for External Interrupt 0 and 1.

## 12 Math Divider Module

### 12.1 Features

The MATH Coprocessor includes the following features:

- Divide function with operand pre-processing and result post-processing
- AHB-Interface supports Byte/half word/ word Register access
- Supports fast execution kernel clock faster than interface clock

### 12.2 Introduction

The MATH Coprocessor (MATH) module supports the CPU in math-intensive computations with a Divider Unit (DIV) for signed and unsigned 32-bit division operations.

**Watchdog Timer (WDT1)****13 Watchdog Timer (WDT1)****13.1 Features**

In Active Mode, the WDT1 acts as a windowed watchdog timer, which provides a highly reliable and safe way to recover from software or hardware failures.

The WDT1 is always enabled in Active Mode. In Sleep Mode, Stop Mode and Debug Mode the WDT1 is disabled.

**Functional Features**

- Watchdog Timer is operating with a from the system clock ( $f_{SYS}$ ) independent clock source ( $f_{LP\_CLK}$ )
- Windowed Watchdog Timer with programmable timing (16, 32, 48, ..., 1008ms period) in Active Mode
- Long open window (200 ms) after power-up, reset, wake-up
- Short open window (30 ms) to facilitate Flash programming
- System safety shutdown to Sleep Mode after 5 missed WDT1 services
- Watchdog is disabled in Debug Mode
- Watchdog cannot be deactivated in Normal Mode
- Watchdog reset is stored in reset status register

## 14 GPIO Ports and Peripheral I/O

The TLE9854QX has 15 port pins organized into three parallel ports: Port 0 (P0), Port 1 (P1) and Port 2 (P2). Each port pin has a pair of internal pull-up and pull-down devices that can be individually enabled or disabled. P0 and P1 are bidirectional and can be used as general purpose input/output (GPIO) or to perform alternate input/output functions for the on-chip peripherals. When configured as an output, the open drain mode can be selected. On Port 2 (P2) analog inputs are shared with general purpose input.

### 14.1 Features

- 10 GPIOs and 5 analog inputs.
- Strong pull-up at Reset-pin and Hall-inputs (except P2.x)

#### **Bidirectional Port Features (P0, P1)**

- Configurable pin direction
- Configurable pull-up/pull-down devices
- Configurable open drain mode
- Configurable drive strength
- Transfer of data through digital inputs and outputs (general purpose I/O)
- Possible readback of pin status when GPIO is configured as output (short detection)
- Alternate input/output for on-chip peripherals

#### **Analog Port Features (P2)**

- Configurable pull-up/pull-down devices
- Transfer of data through digital inputs
- Alternate inputs for on-chip peripherals

**GPIO Ports and Peripheral I/O**

**14.2.2 Port 2**

**Figure 21** shows the structure of an input-only port pin. Each P2 pin can only function in input mode. Register P2\_DIR is provided to enable or disable the input driver. When the input driver is enabled, the actual voltage level present at the port pin is translated into a logic 0 or 1 via a Schmitt-Trigger device and can be read via the register P2\_DATA. Each pin can also be programmed to activate an internal weak pull-up or pull-down device. Register P2\_PUDSEL selects whether a pull-up or the pull-down device is activated while register P2\_PUDEN enables or disables the pull device. The analog input (AnalogIn) bypasses the digital circuitry and Schmitt-Trigger device for direct feed-through to the ADC input channel.

**14.3 Functional Description**

An overview of the available alternate functions of the GPIOs is provided in [Chapter 14.3.1](#).

## 15 General Purpose Timer Units (GPT12)

### 15.1 Features

#### 15.1.1 Features Block GPT1

The following list summarizes the supported features:

- $f_{\text{GPT}}/4$  maximum resolution
- 3 independent timers/counters
- Timers/counters can be concatenated
- 4 operating modes:
  - Timer Mode
  - Gated Timer Mode
  - Counter Mode
  - Incremental Interface Mode
- Reload and Capture functionality
- Shared interrupt: Node 0

#### 15.1.2 Features Block GPT2

The following list summarizes the supported features:

- $f_{\text{GPT}}/2$  maximum resolution
- 2 independent timers/counters
- Timers/counters can be concatenated
- 3 operating modes:
  - Timer Mode
  - Gated Timer Mode
  - Counter Mode
- Extended capture/reload functions via 16-bit capture/reload register CAPREL
- Shared interrupt: Node 1

### 15.2 Introduction

The General Purpose Timer Unit blocks GPT1 and GPT2 have very flexible multifunctional timer structures which may be used for timing, event counting, pulse width measurement, pulse generation, frequency multiplication, and other purposes.

They incorporate five 16-bit timers that are grouped into the two timer blocks GPT1 and GPT2. Each timer in each block may operate independently in a number of different modes such as Gated timer or Counter Mode, or may be concatenated with another timer of the same block.

Each block has alternate input/output functions and specific interrupts associated with it. Input signals can be selected from several sources by register PISEL.

The GPT module is clocked with clock  $f_{\text{GPT}}$ .  $f_{\text{GPT}}$  is a clock derived from  $f_{\text{SYS}}$ .

## 16 Timer2 and Timer21

### 16.1 Features

- 16-bit auto-reload mode
  - selectable up or down counting
- One channel 16-bit capture mode
- Baud-rate generator for U(S)ART

### 16.2 Introduction

Two functionally identical timers are implemented: Timer 2 and 21. The description refers to Timer 2 only, but applies to Timer 21 as well.

The timer modules are general purpose 16-bit timer. Timer 2 can function as a timer or counter in each of its modes. As a timer, it counts with an input clock of  $f_{sys}/12$  (if prescaler is disabled). As a counter, Timer 2 counts 1-to-0 transitions on pin T2. In the counter mode, the maximum resolution for the count is  $f_{sys}/24$  (if prescaler is disabled).

## 17 Capture/Compare Unit 6 (CCU6)

### 17.1 Feature Set Overview

This section gives an overview over the different building blocks and their main features.

#### Timer 12 Block Features

- Three capture/compare channels, each channel can be used either as capture or as compare channel
- Generation of a three-phase PWM supported (six outputs, individual signals for High Side and low-side switches)
- 16-bit resolution, maximum count frequency = peripheral clock
- Dead-time control for each channel to avoid short-circuits in the power stage
- Concurrent update of T12 registers
- Center-aligned and edge-aligned PWM can be generated
- Single-shot mode supported
- Start can be controlled by external events
- Capability of counting external events
- Multiple interrupt request sources
- Hysteresis-like control mode

#### Timer 13 Block Features

- One independent compare channel with one output
- 16-bit resolution, maximum count frequency = peripheral clock
- Concurrent update of T13 registers
- Can be synchronized to T12
- Interrupt generation at period-match and compare-match
- Single-shot mode supported
- Start can be controlled by external events
- Capability of counting external events

#### Additional Specific Functions

- Block commutation for Brushless DC-drives implemented
- Position detection via Hall-sensor pattern
- Noise filter supported for position input signals
- Automatic rotational speed measurement and commutation control for block commutation
- Integrated error handling
- Fast emergency stop without CPU load via external signal ( $\overline{\text{CTRAP}}$ )
- Control modes for multi-channel AC-drives
- Output levels can be selected and adapted to the power stage

**Capture/Compare Unit 6 (CCU6)****17.2 Introduction**

The CCU6 unit is made up of a Timer T12 Block with three capture/compare channels and a Timer T13 Block with one compare channel. The T12 channels can independently generate PWM signals or accept capture triggers, or they can jointly generate control signal patterns to drive AC-motors or inverters.

A rich set of status bits, synchronized updating of parameter values via shadow registers, and flexible generation of interrupt request signals provide means for efficient software-control.

*Note: The capture/compare module itself is named CCU6 (capture/compare unit 6). A capture/compare channel inside this module is named CC6x.*

Capture/Compare Unit 6 (CCU6)

17.2.1 Block Diagram

The Timer T12 can work in capture and/or compare mode for its three channels. The modes can also be combined (e.g. a channel works in compare mode, whereas another channel works in capture mode). The Timer T13 can work in compare mode only. The multi-channel control unit generates output patterns which can be modulated by T12 and/or T13. The modulation sources can be selected and combined for the signal modulation.

**UART1/2****18      UART1/2****18.1      Features**

- Full-duplex asynchronous modes
  - 8-Bit or 9-Bit data frames, LSB first
  - fixed or variable baud rate
- Receive buffered (1 Byte)
- Multiprocessor communication
- Interrupt generation on the completion of a data transmission or reception
- Baud-rate generator with fractional divider for generating a wide range of baud rates, e.g. 9.6kBaud, 19.2kBaud, 115.2kBaud, 125kBaud, 250kBaud, 500kBaud
- Hardware logic for break and sync byte detection
- for UART1: LIN support: connected to timer channel for synchronization to LIN baud rate

In all modes, transmission is initiated by any instruction that uses SBUF as a destination register. Reception is initiated in the modes by the incoming start bit if REN = 1.

The serial interface also provides interrupt requests when transmission or reception of the frames has been completed. The corresponding interrupt request flags are TI or RI, respectively. If the serial interrupt is not used (i.e., serial interrupt not enabled), TI and RI can also be used for polling the serial interface.

**18.2      Introduction**

The UART1/2 provide a full-duplex asynchronous receiver/transmitter, i.e., it can transmit and receive simultaneously. They are also receive-buffered, i.e., they can commence reception of a second byte before a previously received byte has been read from the receive register. However, if the first byte still has not been read by the time reception of the second byte is complete, the previous byte will be lost. The serial port receive and transmit registers are both accessed at Special Function Register (SFR) SBUF. Writing to SBUF loads the transmit register, and reading SBUF accesses a physically separate receive register.

UART1/2

18.2.1 Block Diagram

Figure 25 UART Block Diagram

18.3 UART Modes

The UART1/2 can be used in four different modes. In mode 0, it operates as an 8-Bit shift register. In mode 1, it operates as an 8-Bit serial port. In modes 2 and 3, it operates as a 9-Bit serial port. The only difference between mode 2 and mode 3 is the baud rate, which is fixed in mode 2 but variable in mode 3. The variable baud rate is set by the underflow rate on the dedicated baud-rate generator.

The different modes are selected by setting bits SM0 and SM1 to their corresponding values, as shown in Table 11.

Mode 1 example: 8 data bits, 1 start bit, 1 stop bit, no parity selection, 16 times oversampled, receive & transmit register double buffered, Tx/Rx IRQ(s).

Table 11 UART Modes

SM0	SM1	Operating Mode	Baud Rate
0	0	Mode 0: 8-Bit shift register	$f_{sys}/2$
0	1	Mode 1: 8-Bit shift UART	Variable
1	0	Mode 2: 9-Bit shift UART	$f_{sys}/64$ or $f_{sys}/32$
1	1	Mode 3: 9-Bit shift UART	Variable

## 19 LIN Transceiver

### 19.1 Features

#### General Functional Features

- Compliant to LIN2.2 Standard, backward compatible to LIN1.3, LIN2.0 and LIN 2.1
- Compliant to SAE J2602 (Slew Rate, Receiver hysteresis)

#### Special Features

- Measurement of LIN Master baudrate via Timer 2
- LIN can be used as Input/Output with SFR bits.
- TxD Timeout Feature (optional, on by default)
- Overcurrent limitation and overtemperature protection
- LIN module fully resettable via global enable bit

#### Operation Modes Features

- LIN Sleep Mode (LSLM)
- LIN Receive-Only Mode (LROM)
- LIN Normal Mode (LNM)
- High Voltage Input / Output Mode (LHVIO)

#### Slope Modes Features

- Normal Slope Mode (20 kbit/s)
- Low Slope Mode (10.4 kbit/s)
- Fast Slope Mode (62.5 kbit/s)
- Flash Mode (115 kbit/s, 250 kbit/s)

#### Wake-Up Features

- LIN Bus wake-up

### 19.2 Introduction

The LIN Module is a transceiver for the Local Interconnect Network (LIN) compliant to the LIN2.2 Standard, backward compatible to LIN1.3, LIN2.0 and LIN2.1. It operates as a bus driver between the protocol controller and the physical network. The LIN bus is a single wire, bi-directional bus typically used for in-vehicle networks, using baud rates between 2.4 kBaud and 20 kBaud. Additionally baud rates up to 62.5 kBaud are implemented.

The LIN Module offers several different operation modes, including a LIN Sleep Mode and the LIN Normal Mode. The integrated slope control allows to use several data transmission rates with optimized EMC performance. For data transfer at the end of line, a Flash Mode up to 115 kBaud is implemented. This Flash Mode can be used for data transfer under special conditions for up to 250 kbit/s (in production environment, point-to-point communication with reduced wire length and limited supply voltage).

LIN Transceiver

## 20 High-Speed Synchronous Serial Interface SSC1/2

### 20.1 Features

- Master and Slave Mode operation
  - Full-duplex or half-duplex operation
- Transmit and receive double buffered
- Flexible data format
  - Programmable number of data bits: 2 to 16 bits
  - Programmable shift direction: Least Significant Bit (LSB) or Most Significant Bit (MSB) shift first
  - Programmable clock polarity: idle low or high state for the shift clock
  - Programmable clock/data phase: data shift with leading or trailing edge of the shift clock
- Variable baud rate, e.g. 250kBaude - 8MBaud
- Compatible with Serial Peripheral Interface (SPI)
- Interrupt generation
  - On a transmitter empty condition
  - On a receiver full condition
  - On an error condition (receive, phase, baud rate, transmit error)
  - On a transfer complete condition
- Port direction selection, see [Chapter 14](#)

### 20.2 Introduction

The High-Speed Synchronous Serial Interface (SSC) supports both full-duplex and half-duplex serial synchronous communication. The serial clock signal can be generated by the SSC internally (master mode), using its own 16-Bit baud-rate generator, or can be received from an external master (slave mode). Data width, shift direction, clock polarity, and phase are programmable. This allows communication with SPI-compatible devices or devices using other synchronous serial interfaces.

Data is transmitted or received on lines TXD and RXD, which are normally connected to the pins MTSR (Master Transmit/Slave Receive) and MRST (Master Receive/Slave Transmit). The clock signal is output via line MS\_CLK (Master Serial Shift Clock) or input via line SS\_CLK (Slave Serial Shift Clock). Both lines are normally connected to the pin SCLK. Transmission and reception of data are double-buffered.

**Measurement Unit**

## 21 Measurement Unit

### 21.1 Features

- 1 x 10-bit ADC with 12 inputs
- Supply Voltage Attenuators with attenuation of **VBAT\_SENSE, VS, MONx, P2.x, CSA**.
- 1 x 8-bit ADC with 9 inputs
- Supply Voltage Attenuators with attenuation of **VS, VDDEXT, VSD, VCP, VDDP, VBG, VDDC, T\_SENSE1 (Central Temperature Sensor), T\_SENSE2 (Bridge Driver Charge Pump Temperature Sensor)**.
- Monitoring of PMU bandgap by 8-bit ADC to support functional safety requirements.
- Temperature Sensor to monitor the chip temperature and Bridge Driver Charge Pump temperature.
- Supplement Block with Reference Voltage Generation, Bias Current Generation, Voltage Buffer for NVM Reference Voltage, Voltage Buffer for Analog Module Reference Voltage and Test Interface.

### 21.2 Introduction

The measurement unit is a functional unit that comprises the following associated sub-modules:

**Table 12 Measurement functions and associated modules**

Module Name	Modules	Functions
Central Functions Unit	Bandgap reference circuit + current reference circuit	The bandgap-reference sub-module provides two reference voltages 1. an accurate reference voltage for the 10-bit and 8-bit ADCs. A local dedicated bandgap circuit is implemented to avoid deterioration of the reference voltage caused e.g. by crosstalk or ground voltage shift. 2. the reference voltage for the NVM module
10-bit ADC (ADC1)	10-bit ADC module with 12 multiplexed analog inputs	VBAT_SENSE, VS and MONx measurement. Five (5V) analog inputs from Port 2.x
8-bit ADC (ADC2)	8-bit ADC module with 9 multiplexed inputs	VS/VDDEXT/VSD/VCP/VDDP/VBG/VDDC/BDrv CP Temperature Sensor and Central Temperature Sensor measurement.
Temperature Sensor	Temperature sensor readout amplifier with two multiplexed $\Delta V_{be}$ -sensing elements	Generates output voltage which is a linear function of the local chip ( $T_j$ ) temperature.
Measurement Core Module	Digital signal processing and ADC control unit	1. Generates the control signal for the 8-bit ADC 2 and the synchronous clock for the switched capacitor circuits (temperature sensor) 2. Performs digital signal processing functions and provides status outputs for interrupt generation.

Measurement Unit

21.2.1 Block Diagram

The Structure of the Measurement Functions Module is shown in the following figure.

Figure 28 Measurement Unit-Overview

## **22 Measurement Core Module (incl. ADC2)**

### **22.1 Features**

- 9 individually programmable channels split into two groups of user configurable and non user configurable
- Individually programmable channel prioritization scheme for measurement unit
- Two independent filter stages with programmable low-pass and time filter characteristics for each channel
- Two channel configurations:
  - Programmable upper- and lower trigger thresholds comprising a fully programmable hysteresis
  - Two individually programmable trigger thresholds with limit hysteresis settings
- Status for all channel thresholds
- Operation down to reset threshold of entire system

### **22.2 Introduction**

The basic function of this block is the digital postprocessing of several analog digitized measurement signals by means of filtering, level comparison and interrupt generation. The measurement postprocessing block is built of nine identical channel units attached to the outputs of the 9-channels 8-bit ADC (ADC2). It processes nine channels, where the channel sequence and prioritization is programmable within a wide range.

## 23 Analog Digital Converter ADC10B (ADC1)

### 23.1 Features

The basic function of this block is the digital postprocessing of several analog digitized measurement signals by means of filtering, level comparison and interrupt generation. The measurement postprocessing block is built of the same number of identical channel units attached to the outputs of the 10-bit ADC. It processes all channels, where the channel sequence and prioritization is programmable within a wide range.

#### Functional Features

- 10 Bit SAR ADC with conversion time of 17 clock cycles
- programmable clock divider for sequencer and ADC
- 12 individually programmable channels:
  - 6 HV Channels: VS, VBAT\_SENSE, MON1...MON4
  - 5 LV Channels: P2.0, P2.1, P2.2, P2.3, P2.7
  - 1 Current-Sense Amplifier Channel
- all channels are fully calibrated; calibration can be enabled/disabled by user
- individually programmable channel prioritization scheme for digital postprocessing (dpp)
- two independent filter stages with programmable low-pass and time filter characteristics for each channel
- two channel configurations:
  - programmable upper- and lower trigger thresholds comprising a fully programmable hysteresis
  - two individually programmable trigger thresholds with limit hysteresis settings
- individually programmable upper threshold and lower threshold interrupts and status for all channel thresholds
- one additional differential channel (MON1-MON2) with postprocessing and interrupt generation
- ADC voltage reference completely integrated

*Note:* In case the MONx should be evaluated by the ADC1, it is recommended to add 6.8nF capacitors close to the MONx pin of the device, in order to build an external RC filter to limit the bandwidth of the input signal.

## High-Voltage Monitor Input

# 24 High-Voltage Monitor Input

## 24.1 Features

- Four High-voltage inputs with  $V_S/2$  threshold voltage
- Wake capability for system stop mode and system sleep mode
- Edge sensitive wake-up feature configurable for transitions from low to high, high to low or both directions
- MON inputs can also be evaluated with ADC in Active Mode, using adjustable threshold values
- Selectable pull-up and pull-down current sources available

## 24.2 Introduction

This module is dedicated to monitor external voltage levels above or below a specified threshold. Each MONx pin can further be used to detect a wake-up event by detecting a level change by crossing the selected threshold. This applies to any power mode. Further more each MONx pin can be sampled by the ADC as analog input.

**High-Side Switch****25 High-Side Switch****25.1 Features**

The high-side switch is optimized for driving resistive loads. Only small line inductances are allowed. Typical applications are single or multiple LEDs of a dashboard, switch illumination or other loads that require a high-side switch.

A cyclic switch activation during Sleep Mode or Stop Mode of the system is also available.

**Functional Features**

- Multi purpose high-side switch for resistive load connections (only small line inductances are allowed)
- Overcurrent limitation
- Selectable current capability (25 mA/50 mA/100 mA/150 mA) by adjustable overcurrent detection with automatic shutdown
- Overtemperature detection and automatic shutdown
- Open load detection in on mode with open load current of typ. 1.4 mA
- Interrupt signalling of overcurrent, overtemperature and open load condition
- Cyclic switch activation in Sleep Mode and Stop Mode with cyclic sense support and reduced driver capability: max. 40 mA
- PWM capability up to 25 kHz
- Internal connection to System-PWM Generator (CCU6)
- Slew rate control for low EMI characteristic

**Applications hints**

- The voltage at HSx must not exceed the supply voltage by more than 0.3V to prevent a reverse current from HSx to VS.

## High-Side Switch

### 25.2 Introduction

#### 25.2.1 Block Diagram

Figure 32 High-Side Module Block Diagram (incl. subblocks)

#### 25.2.2 General

The high-side switch can generally be controlled in three different ways:

- In normal mode the output stage is fully controllable through the **SFR** Registers **HSx\_CTRL**. Protection functions as overcurrent, overtemperature and open load detection are available.
- The PWM Mode can also be enabled by a **HSx\_CTRL - SFR** bit. The PWM configuration has to be done in the corresponding PWM Module. All protection functions are also available in this mode. The maximum PWM frequency must not exceed 25 kHz (disabled slew rate control only).
- The high-side switch provides also the possibility of cyclic switch activation in all low power modes (Sleep Mode and Stop Mode). In this configuration it has limited functionality with limited current capability. Diagnostic functions are not available in this mode.

## 26 Bridge Driver (incl. Charge Pump)

### 26.1 Features

The Bridge Driver is intended to drive external normal-level MOSFETs in bridge configuration and provides many diagnostic possibilities to detect faults.

#### Functional Features

- **Flexible control** by SFRs of Bridge Driver module or PWM output signals of CCU6 module
- **Current-driven output stages** to control external n-channel MOSFET gates with flexibly programmable gate current profile
- **Adjustable cross-conduction protection**
- **High-current discharge mode** to reduce dead times and to keep external MOSFETs off during fast transients
- **Passive pull-down mode** to keep external MOSFETs off if the Bridge Driver is disabled
- **Brake mode** with reduced current consumption to statically switch on external MOSFETs
- **Hold mode** with low current consumption to switch on external low-side MOSFETs if the Bridge Driver is disabled
- **Timing measurements** of on/off delays and on/off slope durations
- **Adaptive control mode** with automatic adjustment of gate current values
- **Integrated 2-stage charge pump** for low-voltage operation and statical MOSFET gate control
- **Adjustable voltage monitoring** of Bridge Driver supply voltage (VSD) and charge pump output voltage (VCP)
- **Adjustable short-circuit detection** in on and off state
- **Open-load detection** in off state
- **Overtemperature** detection and shutdown

Bridge Driver (incl. Charge Pump)

26.2 Introduction

26.2.1 Block Diagram

Figure 33 Driver Module Block Diagram (incl. System Connections)

26.2.2 Flexible Control

Each gate driver of the Bridge Driver module can be switched on and off in two different ways:

- Static Mode: The gate drivers are statically switched on or off by the Bridge Driver module SFRs.
- PWM Mode: The gate drivers are PWM-controlled by the System PWM Module (CCU6). The interconnection from the CCU6 output channels to the gate drivers is set up by the Bridge Driver module SFRs.

In both modes all diagnostic and protection functions (short-circuit, open-load, and overtemperature detection) are available.

## Bridge Driver (incl. Charge Pump)

### 26.2.3 Current-Driven Output Stages

The Bridge Driver output stages generate source and sink currents to charge and discharge the gates of the external n-channel MOSFETs. The gate current values are programmable to vary the slew rate at the bridge output.

#### 26.2.3.1 Overview

**Figure 34** shows an overview of one switching cycle of an external MOSFET.

**Figure 34** Switching cycle

The control input signal sets the gate driver either in charge or discharge mode, i.e. it generates a source current flowing out of the driver to charge the gate of an external MOSFET or a sink current flowing into the driver to discharge the gate of an external MOSFET.

Based on the changes on the drain-to-source voltage of the external MOSFET the charging and discharging phases can each be divided into three subphases.

Subphases of the charging phase:

- pre-charge subphase: the gate of the external MOSFET is pre-charged without change on  $V_{DS}$ ; the external MOSFET is still off
- on slope subphase: the gate of the external MOSFET is further charged while the external MOSFET turns on and generates the on slope at  $V_{DS}$

**Bridge Driver (incl. Charge Pump)**

- post-charge subphase: the gate of the external MOSFET is post-charged until the maximum  $V_{GS}$  the gate driver is able to provide; the external MOSFET is on and its  $R_{DS(on)}$  decreases to its minimum value

Subphases of the discharging phase:

- pre-discharge subphase: the gate of the external MOSFET is pre-discharged without significant change on  $V_{DS}$ ; the external MOSFET is still on, but its  $R_{DS(on)}$  increases
- off slope subphase: the gate of the external MOSFET is further discharged while the external MOSFET turns off and generates the off slope at  $V_{DS}$
- post-discharge subphase: the gate of the external MOSFET is post-charged until  $V_{GS}$  is equal to 0V; the external MOSFET is off and is kept off

**26.2.3.2 Switch-On**

**Figure 35** shows the detailed behavior of the gate driver output stage in the switch-on phase and the corresponding electrical characteristic parameters.

**Figure 35 Detailed behavior of the gate driver output stage in the switch-on phase**

After an initial turn-on delay time  $t_{dly(on)}$  the gate charge current  $I_{gate}$  rises and after additional  $t_{rise(on)}$  reaches its specified minimum limit  $I_{chgx,min}$  and stays stable until the gate-to-source voltage of the external MOSFET reaches  $V_{GS} = V_{GS(on)}$ . During the slope at the corresponding SHx pin (i.e.  $SR_{on\_SHx} \neq 0$ ) the average gate current deviates less than  $\Delta I_{chg\_avg\_ \%}$  from the original set point  $I_{chgx}$ . The gate of the external MOSFET is further charged to the high-level output voltage of the gate driver  $V_{Gxy}$ . The time from exceeding  $V_{GS} = V_{GS(on)}$  and reaching  $V_{Gxy,min}$  is defined by  $t_{sat(on)}$ .

Bridge Driver (incl. Charge Pump)

26.2.3.3 Switch-Off

Figure 36 shows the detailed behavior of the gate driver output stage in the switch-off phase and the corresponding electrical characteristic parameters.

Figure 36 Detailed behavior of the gate driver output stage in the switch-off phase

After an initial turn-off delay time  $t_{dly(off)}$  the gate discharge current  $I_{gate}$  rises and reaches its specified minimum limit  $I_{dischg,x,min}$  after  $t_{rise(off)}$  and stays stable until the gate-to-source voltage of the external MOSFET reaches  $V_{GS} = V_{GS(off)}$ . During the slope at the corresponding SHx pin (i.e.  $SR_{off\_SHx} \neq 0$ ) the average gate discharge current deviates less than  $\Delta I_{dischg\_avg\_ \%}$  from the original set point  $I_{dischg,x}$ .

26.2.3.4 Control Modes

There are two basic modes to program the gate current set point values of the output stages: constant mode and sequencer mode.

- In constant mode a simple gate current profile is defined by SFRs where the gate charging phase and the gate discharging phase each have two current set point values and one duration value. The second current set point value remains valid until the driver changes from charge mode to discharge mode or vice versa and is intended to statically keep on or off the external MOSFET at a reduced gate current level to be robust against external shorts at the gate pin.

**Bridge Driver (incl. Charge Pump)**

- In sequencer mode an advanced gate current profile is defined by SFRs where the gate charging phase and the gate discharging phase each are split into consecutive sub phases with individual current set point values and duration values (see **Figure 37**):
  - For the gate charging phase 5 current set point values ( $i_{x(on)}$ ) and 4 duration values ( $t_{x(on)}$ ) are defined by SFRs.
  - The fifth current setpoint value  $i_{5(on)}$  remains valid until the driver changes to discharge mode. This charge current is intended to statically keep on the external MOSFET (e.g. driving an external  $R_{GS}$ ) at a reduced gate current level to be robust against external gate-to-source shorts.
  - For the gate discharging phase 5 current set point values ( $i_{x(off)}$ ) and 4 duration values ( $t_{x(off)}$ ) are defined by SFRs.
  - The fifth current setpoint value  $i_{5(off)}$  remains valid until the driver changes to charge mode. This discharge current is intended to statically keep off the external MOSFET (e.g. during fast voltage transients or EMI) at a reduced gate current level to be robust against external gate-to-drain shorts.
  - At the transition between two gate current set points the actual gate driver output current settles within  $t_{set(seq)}$  to the new gate current set point (see **Figure 38**).

**Figure 37 Gate current set point values generated by the sequencer**

**Bridge Driver (incl. Charge Pump)**

**Figure 38 Gate current settling time**

### 26.2.4 Adjustable Cross-Conduction Protection

The Bridge Driver protects half bridges of external MOSFETs against cross conduction. After switching off one of the MOSFETs of a half bridge the complementary MOSFET cannot be switched on for an optionally programmable time defined by SFRs.

### 26.2.5 High-Current Discharge Mode

The high-current discharge mode provides a low-ohmic path between the Gx and Sx pins to do a fast discharge of the external MOSFET gate and keep the external MOSFET off during fast voltage transients at its drain or source terminals.

The high-current discharge mode is activated in the following situations:

- in the case of an emergency shutdown after detection of an error condition,
- if the complementary external MOSFET is switched on to avoid cross conduction in the external half bridge.

If the adjustable cross-conduction protection feature is enabled the high-current discharge mode is delayed and activated at the same time than the switch-on control signal of the complementary MOSFET.

### 26.2.6 Passive Pull-Down Mode

If the Bridge Driver module is disabled the passive pull-down mode activates resistors  $R_{GGND}$  between the Gx pins and ground to passively keep discharged the gates of the external MOSFETs. During normal operation these pull-down resistors are switched off.

**Bridge Driver (incl. Charge Pump)**

**26.2.7 Brake Mode**

In Brake Mode either both external high-side MOSFETs or both external low-side MOSFETs are statically switched on to short circuit the motor coil to brake the motor or keep it actively blocked during standstill. Since in brake mode no PWM capability is needed the charge pump is set into low-power mode to reduce the current consumption  $I_{VSD\_BK}$  from the VSD pin.

**26.2.8 Hold Mode**

In Hold Mode the external low-side MOSFETs can be switched to an auxiliary gate voltage  $V_{Gxx\_HM}$  to terminate the motor pins in all cases where the Bridge Driver and its charge pump is disabled (including stop mode and sleep mode where the Bridge Driver is disabled by default). This leads to low current consumption  $I_{VSD\_SMHM}$  and  $I_{VSD\_STPMHM}$  from the VSD pin. The Hold Mode is configured by SFRs in the Power Management Unit where the behavior during stop or sleep mode is defined. The configuration includes the channel-individual selection between static and cyclic activation of the Hold mode and programmable timing.

*Note: In Hold Mode the monitoring and protection of the Bridge Driver is not available.*

**26.2.9 Timing Measurements**

The Bridge Driver provides fast comparators with low propagation delay  $t_{cdly}$  at the SHx pins to measure on and off delays  $t_{sdly(on)}$  and  $t_{sdly(off)}$  between changes on the control signals and the corresponding slopes at the SHx pins. Additionally, these comparators are able to measure the on and off slope durations  $t_{sdur(on)}$  and  $t_{sdur(off)}$  at the SHx pins. The measured values are stored in SFRs for further evaluation by software or by the adaptive control mode (see [Chapter 26.2.10](#)).

**Figure 39** shows the thresholds  $V_{SH(high)}$  and  $V_{SH(low)}$  and propagation delay  $t_{cdly}$  of the fast comparators and the measured slope timing parameters  $t_{sdly(on)}$ ,  $t_{sdur(on)}$ ,  $t_{sdly(off)}$ , and  $t_{sdur(off)}$  during PWM actuation of the external low-side MOSFET.

**Figure 39** Comparator thresholds and timing parameters during low-side PWM

**Bridge Driver (incl. Charge Pump)**

**Figure 40** shows the thresholds  $V_{SH(high)}$  and  $V_{SH(low)}$  and propagation delay  $t_{cdly}$  of the fast comparators and the measured slope timing parameters  $t_{sdly(on)}$ ,  $t_{sdur(on)}$ ,  $t_{sdly(off)}$ , and  $t_{sdur(off)}$  during PWM actuation of the external high-side MOSFET.

**Figure 40** Comparator thresholds and timing parameters during high-side PWM

For plausibility checks of the fast comparators and the assigned timing measurement counters there is an additional channel on/off delay measurement counter which can be switched to each channel's control signals and the corresponding drain-to-source voltage monitoring comparator outputs.

**26.2.10 Adaptive Control Mode**

The Bridge Driver provides an optional adaptive control mode if the output stages are controlled by the sequencer mode. The target values for on and off delays are defined by SFRs. In order to reach these target values, the adaptive control algorithm reads the results from the timing measurement and adjusts the current set point of the first gate charging sub phase  $i_{1(on)}$  and the first gate discharging sub phase  $i_{1(off)}$  accordingly.

**26.2.11 Integrated 2-Stage Charge Pump**

The Bridge Driver is supplied by an integrated 2-stage charge pump which provides a stable voltage  $V_{CP}$  above the battery voltage. This enables the Bridge Driver to operate down to low battery voltage values and to statically switch on the external MOSFETs.

The charge pump output voltage is programmable by SFRs. The charge pump frequency is continuously varied between two boundary frequencies defined by SFRs.

---

**Bridge Driver (incl. Charge Pump)****26.2.12 Adjustable Voltage Monitoring**

The supply voltages of the Bridge Driver (VSD and VCP) are monitored by the Measurement Unit. The Bridge Driver including the charge pump can be optionally disabled at undervoltage or overvoltage of the monitored signals.

**26.2.13 Adjustable Short Circuit Detection**

For short circuit detection the drain-to-source comparators of the Bridge Driver are used to compare the voltage drops across the external MOSFETs to the programmable threshold voltage  $V_{DSMONVTH}$ . During transitions from off to on and vice versa the comparator output signals are ignored for a programmable blank time defined by SFRs.

In on state the external MOSFETs are switched off automatically if a stable short-circuit condition is detected for a SFR programmable filter time and an interrupt is generated. It can be selected by SFR if all MOSFETs are switched off or only the one where the short-circuit condition was detected.

In off state the motor phases can be pulled up or pulled down by the diagnostic currents  $I_{PUDiag}$  and  $I_{PDDiag}$ . The drain-to-source comparator output signals can be read by SFRs to check if the motor phase voltages change according to the activated diagnostic currents.

**26.2.14 Open-Load Detection**

For open-load detection in off state the pull-up diagnostic current  $I_{PUDiag}$  of one half bridge and the pull-down diagnostic current  $I_{PDDiag}$  of the other half bridge are activated. The pull-down diagnostic current  $I_{PDDiag}$  is able to overdrive the pull-up diagnostic current  $I_{PUDiag}$  (by  $I_{PDDiag\_OD}$ ). Therefore, in the case of a connected motor, both motor phase voltages are pulled-down. In the case of a disconnected motor, one motor phase voltage is pulled down while the other is pulled up according to the diagnostic current settings. The reaction of the motor phase voltages can be checked by the drain-to-source comparators of the Bridge Driver and their corresponding SFR status bits.

**26.2.15 Overtemperature**

The temperature of the Bridge Driver Charge Pump is monitored by a dedicated temperature sensor of the Measurement Unit for temperature warning signalling and overtemperature shutdown of the Bridge Driver.

## 27 Current Sense Amplifier

### 27.1 Features

#### Main Features

- Programmable gain settings:  $G = 10, 20, 40, 60$
- Differential input voltage:  $\pm 1.5V / G$
- Wide common mode input range  $\pm 2 V$
- Low settling time  $< 1.4 \mu s$

### 27.2 Introduction

The current sense amplifier in [Figure 41](#) can be used to measure near ground differential voltages via the 10-bit ADC. Its gain is digitally programmable through internal control registers.

Linear calibration has to be applied to achieve high gain accuracy, e.g. end-of-line calibration including the shunt resistor.

[Figure 41](#) shows how the current sense amplifier can be used as a low-side current sense amplifier where the motor current is converted to a voltage by means of a shunt resistor  $R_{SH}$ . A differential amplifier input is used in order to eliminate measurement errors due to voltage drop across the stray resistance  $R_{Stray}$  and differences between the external and internal ground. If the voltage at one or both inputs is out of the operating range it has to be taken into account that the input circuit is overloaded and needs a certain specified **recovery time**.

In general, the external low pass filter should provide suppression of EMI.

### 28.3 Connection of P0.2 for SWD debug mode

To enter the SWD debug mode, P0.2 needs to be 0 at the rising edge of the reset signal.

P0.2 has an internal pulldown, so it just needs to be ensured that there is no external 1 at P0.2 when the debug mode is entered.

### 28.4 Connection of TMS

For the debug mode, the TMS pin needs to be 1 at the rising edge of the reset signal. This is controlled by the debugger. The TMS pin has an internal PD.

To avoid the device entering the debug mode unintendedly in the final application, adding an external pull-down additionally is recommended.

### 28.5 ESD Tests

*Note:* Tests for ESD robustness according to IEC61000-4-2 “gun test” (150pF, 330Ω) were performed. The results and test condition will be available in a test report. The target values for the test are listed in **Table 15** below.

## Electrical Characteristics

### Notes

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.

### 29.1.2 Functional Range

Note: Within the functional range the IC operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the related electrical characteristics table.

**Table 23 Functional Range**

$T_j = -40^\circ\text{C}$  to  $+150^\circ\text{C}$ , all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Supply voltage in Active Mode	$V_{S\_AM}$	5.5	-	28	V		P_1.2.1
Extended Supply voltage in Active Mode-range 1	$V_{S\_AM\_exten\_d\_1}$	28	-	40	V	<sup>1)</sup> Functional with parameter deviation	P_1.2.24
Extended Supply voltage in Active Mode	$V_{S\_AM\_exten\_d\_2}$	3.0	-	28	V	<sup>2)</sup> Functional with parameter deviation	P_1.2.2
Supply voltage in Active Mode for MOSFET Driver Supply	$V_{SD\_AM}$	5.4	-	29	V		P_1.2.12
Extended maximum supply voltage in Active Mode for MOSFET Driver Supply	$V_{SD\_AM\_max\_extended}$	29	-	32	V	<sup>1)</sup> Functional with parameter deviation	P_1.2.13
Supply voltage for LIN Transceiver	$V_{S\_AM\_LIN}$	5.5	-	18	V	Parameter Specification	P_1.2.3
Extended Supply voltage for LIN Transceiver and Monitoring Inputs (MONx) for all device modes	$V_{S\_AM\_LIN\_e\_xtend}$	4.0	-	28	V	Functional with parameter deviation	P_1.2.4
Supply voltage in Stop Mode	$V_{S\_Stopmin}$	3.0	-	-	V		P_1.2.5
Min. Supply voltage in Sleep Mode	$V_{S\_Sleepmin}$	3.0	-	-	V		P_1.2.6

## Electrical Characteristics

**Table 23 Functional Range** (cont'd)

$T_j = -40^\circ\text{C}$  to  $+150^\circ\text{C}$ , all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Supply Voltage transients slew rate	$dV_S/dt$	-5	-	5	V/ $\mu\text{s}$	<sup>3)</sup>	P_1.2.7
Output current on any GPIO	$I_{OH}, I_{OL}$	-5	-	5	mA	<sup>3)</sup>	P_1.2.8
Output sum current for all GPIO pins	$I_{GPIO,sum}$	-50	-	50	mA	<sup>3)</sup>	P_1.2.9
Junction Temperature	$T_j$	-40	-	150	$^\circ\text{C}$		P_1.2.11

1) This operation voltage range is only allowed for a short duration:  $t_{max} < 400$  ms

2) Hall-Supply, ADC, SPI, UART, NVM, RAM, CPU fully functional and in spec down to  $V_S = 3$  V. Actuators (High-Side Switch, MOSFET Driver) in  $V_S$  range from  $3\text{ V} < V_S < 5.5\text{ V}$  (High-Side Switch) or  $3\text{ V} < V_S < 4.4\text{ V}$  (MOSFET Driver) functional but some parameters can be out of spec

3) Not subject to production test, specified by design

### 29.2.6 Power Down Voltage Regulator (PMU Subblock) Parameters

The PMU Power Down voltage regulator consists of two subblocks:

- Power Down Pre regulator: VDD5VPD
- Power Down Core regulator: VDD1V5\_PD (Supply used for GPUDATAx registers)

Both regulators are used as purely internal supplies. The following table contains all relevant parameter:

- 1) Overload conditions must not occur on pin XTAL1. This Parameter is not valid for stop mode.
- 2) Not subject to production test, specified by design
- 3) The amplitude voltage  $V_{AX1}$  refers to the offset voltage  $V_{OFF}$ . This offset voltage must be stable during the operation and the resulting voltage peaks must remain within the limits defined by  $V_{IX1}$ .
- 4) Default hysteresis settings ( $SCU\_XTAL\_CTRL.XTALHYSEN = 1_B$ ,  $SCU\_XTAL\_CTRL.XTALHYSCTRL = 11_B$ )
- 5) Valid for rectangular full-swing input signals.
- 6) Hysteresis disabled ( $SCU\_XTAL\_CTRL.XTALHYSEN=0_B$ )
- 7) This performance is only valid for Prescaler Mode (VCO Bypass mode).
- 8) This performance is only valid for PLL Normal Mode.

Erase time per sector/page incl. Firmware routine runtime for erase operation	$t_{\text{ER\_FW}}$	-	-	5	ms	<sup>1)</sup> $3\text{V} < V_S < 28\text{V}$	P_4.1.21
Data retention time	$t_{\text{RET}}$	20	-	-	years	<sup>1)</sup> 1,000 erase / program cycles	P_4.1.3
Data retention time	$t_{\text{RET}}$	50	-	-	years	<sup>2) 1)</sup> 1,000 erase / program cycles; $T_j = 30^\circ\text{C}$	P_4.1.4
Flash erase endurance for user sectors	$N_{\text{ER}}$	30	-	-	kcycles	<sup>1)</sup> Data retention time 5 years	P_4.1.5
Flash erase endurance for security pages	$N_{\text{SEC}}$	10	-	-	cycles	<sup>1)</sup> Data retention time 20 years; $T_j = 25^\circ\text{C}$	P_4.1.6
Drain disturb limit	$N_{\text{DD}}$	32	-	-	kcycles	<sup>3) 1)</sup>	P_4.1.7

1) Not subject to production test, specified by design

2) Derived by extrapolation of lifetime tests.

3) This parameter limits the number of subsequent programming operations within a physical sector without a given page in this sector being (re-)programmed. The drain disturb limit is applicable if wordline erase is used repeatedly. For normal sector erase/program cycles this limit will not be violated. For data sectors the integrated EEPROM emulation firmware routines handle this limit automatically, for wordline erases in code sectors (without EEPROM emulation) it is recommended to execute a software based refresh, which may make use of the integrated random number generator NVMBRNG to statistically start a refresh.

Reset Pin Input Filter Time	$T_{\text{filt\_RESET}}$	3	4.5	6	$\mu\text{s}$	<sup>6)</sup>	P_5.2.13

- 1) Not subject to production test, specified by design
- 2) The values for  $I_{OLnom}$ ,  $I_{OLmax}$ ,  $I_{OHnom}$ ,  $I_{OHmax}$  depend on the driver strength settings (see register bit fields SCU\_Px\_POCON0.Px\_PDMy) and are defined by P\_5.2.20 ... P\_5.2.25
- 3) The maximum deliverable output current of a port driver depends on the selected output driver mode. The limit for pin groups must be respected (see P\_1.2.9).
- 4) The given values are worst-case values. In production test, this leakage current is only tested at  $150^\circ\text{C}$ ; other values are ensured by correlation. For derating, please refer to the following descriptions:  
 Leakage derating depending on temperature ( $T_j = \text{junction temperature } [^\circ\text{C}]$ ):  $I_{OZ} = 0.05 \times e^{(1.5 + 0.028 \times T_j)}$  [ $\mu\text{A}$ ]. For example, at a temperature of  $95^\circ\text{C}$  the resulting leakage current is  $3.2\mu\text{A}$ .  
 Leakage derating depending on voltage level ( $DV = V_{DDP} - V_{PIN}$  [V]):  $I_{OZ} = I_{OZtempmax} - (1.6 \times DV)$  [ $\mu\text{A}$ ]  
 This voltage derating formula is an approximation which applies for maximum temperature.
- 5) Keep current: Limit the current through this pin to the indicated value so that the enabled pull device can keep the default pin level:  $V_{PIN} \geq V_{IH}$  for a pull-up;  $V_{PIN} \leq V_{IL}$  for a pull-down.  
 Force current: Drive the indicated minimum current through this pin to change the default pin level driven by the enabled pull device:  $V_{PIN} \leq V_{IL}$  for a pull-up;  $V_{PIN} \geq V_{IH}$  for a pull-down.  
 These values apply to the fixed pull-devices in dedicated pins and to the user-selectable pull-devices in general purpose IO pins.
- 6) This filter time and its variation is derived from the time base  $t_{LP\_CLK} = 1 / f_{LP\_CLK}$ .

Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

## 31 Abbreviations

The following acronyms and terms are used within this document. List see in [Table 81](#).

**Table 81 Acronyms**

Acronyms	Name
AHB	Arm® Advanced High-Performance Bus
CCU6	Capture Compare Unit 6
CGU	Clock Generation Unit
CLKMU	Clock Management Unit
CMU	Cyclic Management Unit
CSA	Current Sense Amplifier
DPP	Data Post Processing
ECC	Error Correction Code
EEPROM	Electrically Erasable Programmable Read Only Memory
GPIO	General Purpose Input Output
HV	High Voltage
ICU	Interrupt Control Unit
LDO	Low DropOut voltage regulator
LIN	Local Interconnect Network
LSB	Least Significant Bit
LTI	Lead Tip Inspection
LV	Low Voltage
MCU	Memory Control Unit
MF	Measurement Functions
MPU	Memory Protection Unit
MRST	Master Receive / Slave Transmit, corresponds to MISO in SPI
MSB	Most Significant Bit
MTRSR	Master Transmit / Slave Receive, corresponds to MOSI in SPI
MU	Measurement Unit
NMI	Non Maskable Interrupt
NVIC	Nested Vector Interrupt Controller
OSC	Oscillator
OTP	One Time Programmable
PBA	Peripheral Bridge
PC	Program Counter
PCU	Power Control Unit
PD	Pull Down
PGU	Power supply Generation Unit
PLL	Phase Locked Loop
